Demand More For Your Data

Peer perspectives on what storage works today—and tomorrow.

PURESTORAGE®

The Introduction

The size of your organization or workload shouldn't dictate the value of your data, or what features you have to do without in your storage. But legacy storage vendors have forced a choice on you: buying so-called "mid-range" or "enterprise" storage, based mainly on your budget and how critical the data is in a given workload. The very concept is an idea rooted in the limitations of legacy storage architectures. At Pure Storage®, we think that all data should be treated equally. After all, your data is the most important asset in your organization. Why shouldn't it have the best capabilities for data protection and performance?

Users of Pure Storage know that they can demand more for their data. That's because Pure delivers enterprise-level capabilities across all our products, for organizations and workloads of all sizes. Pure's modern, software-centric approach provides a foundation for delivering enterprise features that aren't tied to specific hardware products. So, regardless of your budget or workload, you get advanced capabilities like synchronous replication and ransomware recovery included in your Evergreen Storage™ subscription.

Directly from peer-review websites, we've collected reviews written by IT leaders just like you who know that with Pure, their organizations can demand more for their data. They now have the advanced capabilities they need, while staying agile and adapting to ever-changing needs—all without the hassles of migrations, forklift upgrades, storage rebuys, and unpredictable costs.

Read on for reviews that will inspire you to demand more for your data—and from your storage vendor.

Pure Storage FlashArray™: Enterprise-wide Benefits More Than Worth the Cost

"Our FlashArrays have been 100% reliable. In the four-years-plus we have been relying on them, we have not experienced a single moment of unplanned downtime due to these arrays. Their hardware design is solid-state and fault-tolerant, redundant everywhere. This allows zero-downtime upgrades for all of their OS, management, and driver software. We've been through numerous (10+) software upgrades on two arrays and have never experienced any interruption in service or data loss."
